

## Myosh Makes Its Mark Online

One of the more remarkable – for simplicity and comprehensiveness – examples of safety management software to be seen at The Safety Show Sydney is Myosh.

Myosh is a risk management, OHS system accessible via the Internet by a firm's staff anywhere in the world.

With harmonisation of Workplace Health and Safety legislation across all jurisdictions commencing in 2012, there will be an increase in red tape – as there was with the introduction of the GST.

Without safety management software in place, compliance will be difficult. Myosh provides a timely solution, as it is designed to automate the processes required to demonstrate compliance.

Myosh is used and recommended by the largest of safety organisations including The National Safety Council of Australia and The Industrial Foundation for Accident Prevention.

As staff will be only too happy to demonstrate at the Myosh stand, all modules are integrated, enabling relationships, such as between hazards and incidents, to be tracked.

Decisions and actions are managed in a central database, providing an instant snapshot of actions and the status of each action in any situation.

Management reports, reminders and overdue notifications ensure the commitment of all parties, and all data is collated and presented in up-to-date reports, graphs and statistics.

Myosh has versions for small and large organisations alike and can be customised to meet specific requirements.

Importantly, training can be delivered online, and firms can create and develop their own online learning programs.
